

Supplementary Fig. 2. A-F : Alveolar morphological changes over time seen by Hematoxylin and Eosin staining in mild traumatic brain injury (TBI) and sham-operated mice (scale bar=100 μ m). D-F : Sections show morphological alveolar changes and partial disruption of the capillary membrane. All slides were observed under light microscopy at $\times 100$ original magnification. The morphology of alveolar and alveoli wall were changed by cell infiltration after mild TBI.
