Supplemental Figure Legend

Figure S1. Expression of CCR3 and IL-5Rα in eosinophils isolated from peripheral blood. Peripheral blood obtained from a healthy human volunteer was treated with ACK lysis buffer to lyse erythrocytes. Isolated cells were then stained with indicated volumes of anti-human CCR3, anti-human IL-5Rα, or isotype control. Analyzed cells expressing high level of CCR3 or IL-5Rα correspond to SSC$^{\text{high}}$ eosinophils in the peripheral blood. The results shown are representative of two independent experiments.
