Supplementary Table 2. The log-relative risks in the Asian American Gail model

\[(0.07499 \times \text{age at menarche}) + (0.55264 \times \text{number of previous breast biopsy}) + (0.27638 \times \text{age at first liver birth}) + (0.79186 \times \text{number of first-degree relatives with breast cancer}) + (-0.07257 \times \text{ADH1}) + (0.60432 \times \text{ADH2})\]

Age at menarche: 0 = age over or at 14, 1 = age 12 to 13, 2 = age under or at 11
Number of previous breast biopsy: 0 = no, 1 = one time, 2 = more than one time
Age at first liver birth: 0 = age under or at 19, 1 = age 20 to 24, 2 = age 25 to 29 or nulliparous, 3 = age over or at 30
Number of first-degree relatives with breast cancer: 0 = no, 1 = one, 2 = more than one
ADH1: 1 = no atypical ductal hyperplasia in biopsy, 0 = no biopsy
ADH2: 1 = atypical ductal hyperplasia in biopsy, 0 = no biopsy
