Supplementary Fig. 2. Illustrative follow-up case of VBDA using TOF-MRA.

A, B. 64-year-old female underwent stent-assisted coil embolization (SACE) for aneurysmal growth of right distal VA dissecting aneurysm. C. Angiography after SACE revealed well-occluded aneurysm with preservation of posterior inferior cerebellar artery. D. TOF-MRA after 6 months showed well-occluded aneurysm without contrast filling within dissecting aneurysm (dotted arrow). E, F. TOF-MRA, taken. TOF-MRA = time-of-flight magnetic resonance angiography, VA = vertebral artery, VBDA = vertebrobasilar dissecting aneurysm.
