Supplementary Fig. 1. Comparison of treatment responses between UCBI+IST and IST treatments at 1 month and 3 months. No difference in CR was observed between the two groups at 1 month; meanwhile, ORR was higher in the UCBI+IST group than the IST group (A). Both CR and ORR were increased in the UCBI+IST group, compared with the IST group, at 3 months (B). Differences between groups were detected by chi-square test. *p*<0.05 was considered significant. IST, immunosuppressive therapy; UCBI, umbilical cord blood infusion; ORR, overall response rate; CR, complete response; PR, partial response; NR, no remission.
