Dark gray: Comparison, Light gray: Column compared with row, White: Row compared with column. Data are RRs (95% CI) in the column-defining treatment compared with the row-defining treatment or row-defining treatment compared with the column-defining treatment. For column compared with row, RRs higher than 1 favour the column-defining treatment. For row compared to column, RRs lower than 1 favour the row-defining treatment. RR = risk ratio. CI = confidence interval. Pro: proprofol; Pal: palonosetron; Tro: tropisetron; Gra: granisetron; Ond: ondansetron; Ram: ramosetron; Dro: droperidol; Int: intralipid; Dex: dexamethasone; Met: metoclopramide; Pla: placebo

Supplementary Fig. 12. League table. RR (95% CI) is calculated between both horizontal axis treatment and vertical axis treatment. Comparisons between treatments should be read from left to right, and the estimates in the cell in common between the vertical axis treatment and the horizontal axis treatment. Treatments are reported from left upper quadrant to right lower quadrant as per the cluster ranking for transition and acceptability. For transition, an RR less than 1 favors the row-defined treatment. For acceptability, an RR less than 1 favors the row-defined treatment. RR: relative ration; CI: confidence interval.
