

Supplementary Fig. 1. Intraoperative levels in NMB changes

Group P vs. Group R and their group-by-time interaction effects are shown using a linear mixed model. Graphs of T4/T1 (percentage) were plotted for each value presented as the estimated mean with standard deviation. T1 and T4 are the first and fourth twitch responses, respectively, to TOF stimulation of the ulnar nerve.

P: propofol, R: remimazolam, NMB: neuromuscular blocking, TOF: train-of-four.
