
Supplementary Fig. 3. Comparison of average TCRB V-J gene utilization between admission and 7-day follow-up according to Fisher grades II and III (A) and IV (B). V gene and J gene segments are arranged on the x- and the y-axes. Different colors indicate the differences in gene frequencies of poor-grade SAH patients compared to good-grade SAH patients. TCRB : T cell receptor β-chain, SAH : subarachnoid hemorrhage.
