

**S3 Fig.** Kaplan-Meier analysis for estimating the risk of *kidney cancer* development over 10 years (2003-2013) according to the medication types, including never medication, partial medication (less than 60%), and full medication (more than 60%), particularly in those who were prescribed with aspirin (A) and statins (B). Log-rank test was used to define the statistical differences between these groups.
