

S4 Fig. Kaplan-Meier analysis for estimating the overall survival rates according to the medication types, including never medication, partial medication (less than 60%), and full medication (more than 60%), particularly in those who were prescribed with nonsteroidal anti-inflammatory drug in patients with prostate cancer (A), and in those who were prescribed with aspirin (B) and statins (C) in patients with kidney cancer, respectively. Log-rank tests were used to define the statistical differences between these groups. NSAID, nonsteroidal anti-inflammatory drug.
