

S2 Fig. Immunohistochemical staining of C-C motif chemokine receptor 6 (CCR6) expression in rectal cancer tissues. (A) Specimen with low CCR6 expression (×100). (B) Specimen with low CCR6 expression (×400). (C) Specimen with high CCR6 expression (×100). (D) Specimen with high CCR6 expression (×400). Panels B and D showed the higher magnification from the area of the boxes in panels A and C, respectively. In the high CCR6 specimens, the expression level was elevated both in the tumor cells and the adjacent tissue. But the elevation of expression level was more obvious in the tumor cells.
