Values are presented as number (%) or the mean±standard deviation or median (interquartile range).

ALK, anaplastic lymphoma kinase; BMI, body mass index; COPD, chronic obstructive pulmonary disease; CT, computed tomography; DLco, diffusing capacity for carbon monoxide; DM, diabetes mellitus; EGFR, epidermal growth factor receptor; FEV₁, forced expiratory volume in one second; FVC, forced vital capacity; NSCLC, non-small cell lung cancer; NTM, non-tuberculous mycobacteria; TB, tuberculosis. ^{a)}Patients could have more than one comorbidity, ^{b)}Patients with active malignancies of other organs at the time of lung cancer diagnosis were excluded. All previous cancer history patients were treated by local treatment, and then follow-up with no evidence of cancer recurrence. Stomach cancer (n=18), colon cancer (n=10), prostate cancer (n=6), thyroid cancer (n=5), hepatic cancer (n=3), bladder cancer (n=2), endometrial cancer (n=2), oral cavity cancer (n=2), skin cancer (n=2), cervical cancer (n=1), esophageal cancer (n=1), and renal cancer (n=1), ^{c)}In the case of synchronous lung cancer, the T category of the main lesion were indicated, ^{d)}Large cell neuroendocrine carcinoma (n=17), pleomorphic carcinoma (n=4), adenosquamous carcinoma (n=2), and poorly differentiated carcinoma (n=2), ^{e)}There were a total of 38 subjects in the No endosonography group and a total of 21 subjects in the Endosonography first group who did not undergo EGFR mutation testing. The "others" mutations included L861Q (exon 21), G719X (exon 18), T790M (exon 20), exon 20 insertion, and S768I (exon 20), ^{f)}There were a total of 35 subjects in the No endosonography group and a total of 21 subjects in the Endosonography first group who did not undergo *ALK* mutation testing.
