

S2 Table. Cumulative National HPV vaccination rates by year of birth

Year of birth	No. of subjects	1st dose		2nd dose	
		No. of vaccinated people	Vaccination rate (%)	No. of vaccinated people	Vaccination rate (%)
2004	227,607	179,082	78.7	154,836	68.0
2005	209,836	185,660	88.5	165,677	79.0
2006	216,701	194,432	89.7	171,370	79.1
2007	240,391	217,817	90.6	196,656	81.8
2008	227,099	202,265	89.1	175,638	77.3
2009	216,821	182,761	84.3	131,537	60.7
2010	228,756	90,317	39.5	20,995	9.2

Since 2022, the vaccination age has been expanded to 12-17 years old. Thus, girls who have not completed vaccination in the previous project year are eligible to receive additional vaccinations. Table shows the cumulative vaccination statistics as of December 31, 2022. Those born in 2010 are the first to receive vaccinations after the age expansion, making it possible for them to be vaccinated between the ages of 12 and 17. As a result, the cumulative vaccination rate is significantly lower compared to other birth years. HPV, human papillomavirus.
