

S12 Fig. Multivariate Cox analysis using ToPP platform 17-gene stemness score (LSC17) results. The survival difference is statistically significant, with a log-rank test value of $p < 0.0001$ and a hazard ratio (HR) of 4.67 (95% confidence interval, 2.82 to 7.76), indicating that patients in the high-risk group have a significantly poorer prognosis. TCGA-LAML, The Cancer Genome Atlas – Acute Myeloid Leukemia.
