

Supplementary Figure 3. Magnetic field distribution in the brain. (A) Distribution of the magnetic field in the infarct area: a representative patient is shown. In this clinical trial, the magnetic field amplitude was set to expose the brain areas suffering the ischemic event to at least 1 mT. MRI images of a representative active patient at (B) baseline, (C) 7 days, and (D) 45 days. MRI, magnetic resonance imaging; DWI, diffusion-weighted imaging; FLAIR, fluid-attenuated inversion recovery.
