Supplemental Fig. S1. The cut-off value of risk factors for coronavirus disease 2019 mortality. (A) The area under the receiver operating characteristic (ROC) curve of fasting plasma glucose (FPG) level for the prediction of mortality was 0.759 (95% confidence interval [CI], 0.660 to 0.841; $P<0.0001$). The optimal cut-off value obtained from the maximum Youden's index (J) was 168 mg/dL (sensitivity 66.67%, specificity 84.62%). (B) The area under the ROC curve of age for the prediction of mortality was 0.702 (95% CI, 0.605 to 0.787; $P=0.0001$). The optimal cut-off value obtained from the maximum Youden's index (J) was 72 years (sensitivity 73.33%, specificity 63.16%).
