

**Supplemental Fig. S1.** Incidence of cardiovascular disease (CVD) according to different high-density lipoprotein cholesterol (HDL-C) and low-density lipoprotein cholesterol (LDL-C) subgroups. (A, B, C) The incidence of CVD is depicted across different HDL-C and LDL-C cut-offs (50 mg/dL for HDL-C and 100 or 130 mg/dL for LDL-C). Numbers above each bar indicates the incidence of CVD in each subgroup during a median of 15.6 years of follow-up. TyG, triglyceride-glucose.
