

Supplementary Fig. S1. Survival analysis. Kaplan-Meier estimation of overall survival (OS) in primary squamous cell carcinoma (SCC) and metastatic SCC of the salivary gland. The primary SCC group did not show difference in OS compared to the metastatic SCC group ($p=.992$, A). When restricting analysis to the primary SCC group only ($n=8$), the p16, p53, and AR immunopositive groups exhibited a tendency toward poor OS ($p=.678$, B; $p=.384$, C; $p=.758$, D, respectively).
