

Supplementary Fig. 1. Receiver operating characteristic (ROC) curve with area under the curve (AUC) for stomach width/length (W/L) ratio after 32 weeks and 36 weeks of gestational age (GA) for the suspicion of esophageal atresia (EA) (exclusion of 6 EA cases without polyhydramnios). After 32 weeks: Cut-off value <1.375 , AUC=0.693 (95% confidence interval [CI], 0.526–0.861; $P=0.032$). Sensitivity 0.846, specificity 0.500, positive likelihood ratio (LR^+) 1.692, negative likelihood ratio (LR^-) 0.308). After 36 weeks: Cut-off value <1.465 , AUC=0.684 (95% CI, 0.461–0.906; $P=0.091$). Sensitivity 0.761, specificity 0.625, LR^+ 2.029, LR^- 0.382.
