

Supplemental Data Fig. S1. Scattergrams for *E. coli* comparing MICs obtained using Sensitivity according to the CLSI guidelines and the disk zone diameters obtained using the EUCAST-RAST method with incubation times of 4 (upper), 6 (middle), and 8 (lower) hours for the following antimicrobial agents: (A) piperacillin-tazobactam, (B) ceftoloxime, (C) ceftazidime, (D) imipenem, (E) meropenem. Vertical bold dotted lines represent the CLSI breakpoints and horizontal bold dotted lines represent the EUCAST-RAST breakpoints. The numbers represent the number of isolates with MICs and EUCAST-RAST inhibition zone diameters. (Continued to the next page)

Supplemental Data Fig. S1. Continued. (F) ciprofloxacin, (G) amikacin, (H) gentamicin, (I) tobramycin, and (J) trimethoprim-sulfamethoxazole. Abbreviations: CA, categorical agreement; mE, minor error; ME, major error; VME, very major error; MIC, minimal inhibitory concentration; EUCAST, European Committee on Antimicrobial Susceptibility Testing; RAST, rapid antimicrobial susceptibility testing.
