Supplementary Table 6. Multilevel multivariable logistic regression with propensity adjustment for the association of rheumatoid arthritis with short-term mortality for the whole cohort: alternative modeling for the impact of missing gender data

Modeling approach	Adjusted odds ratio (95% CI)	P-value
Include only hospitalizations with gender data	0.910 (0.856–0.967)	<0.001
Include hospitalizations with missing gender data as indicator variable	0.886 (0.837–0.939)	<0.001

CI: confidence interval.
